Novi data exchange guidance

Novi relies on regular data updates from certifying bodies to keep the information shared with retailer channel partners accurate, valid, and current. Each certifying organization has different technical capabilities, so Novi supports multiple exchange methods — automatic and manual.

IDEAL · PRODUCT LEVEL

You hold certification data mapped to individual product variants. Novi distributes it to channel partners as-is.

MINIMUM · CERTIFICATE LEDGER

You hold certificates but not products. Novi validates brand-provided claims against your ledger.

Ideal data structure

Novi distributes certification data at the product variant level. Where this format is available, it is what we would like to receive.

FIELD	WHAT IT CARRIES
Brand name	The brand holding or claiming the certification
Variant / product name	The saleable item the certification applies to
Variant identifier	GTIN or MPN
Certification	Name of the standard or certification granted
Certificate / license ID	The reference used to confirm the certification is valid
Certification status	Valid · Expired · Revoked / invalid
Certification metadata	Issuer, issue date, expiration date, standard version

Where this data does not exist at the product level, Novi's data network and brand-facing self-service workflows apply verified certificate data to the variant. Please provide as much product data as you have, so certificates are applied accurately and in accordance with your standards.

Dark mode

Minimum data required

Without product-level claim data, Novi validates the brand-provided claim by checking the certificate. You then provide a ledger of certifications rather than products:

Certifications issued

Each certification and its ID — certificate number, license number, or equivalent reference.

Scope

Ideally a list of products tied to the certification. If unavailable, how it is applied.

Where claims are not certified at the product level — a brand claiming certified materials, for example — we work with you to confirm the correct data points.

NEVER SHARED WITH CHANNEL PARTNERS

Manufacturer information (names, identification codes) · parent company.

Exchange methods

AUTOMATIC · PREFERRED

1 · API integration

Novi connects directly to your API endpoint to retrieve the latest certification data or validate brand-provided data.

Frequency · continuous or scheduled (nightly, weekly)
Why · real-time sync, minimal manual effort, highest accuracy

2 · S3 bucket exchange

You drop updated files into a secure Amazon S3 bucket managed by Novi. CSV or Excel preferred.

Frequency · your update cadence
Why · automated ingestion and validation, secure transfer, low engineering lift

MANUAL

3 · Shared Google Drive folder

You upload the latest file — for example `Certifications_YYYYMMDD.csv` — to a shared folder. Novi retrieves and processes it.

Frequency · monthly or quarterly
Why · familiar tools, no setup, simple version control

4 · Email attachment

You send the most recent data file to certdata@noviconnect.com. Novi retrieves and updates the data.

Frequency · agreed cadence, typically monthly
Why · no new systems to configure, quick and low-barrier

CONTACT

For setup or support, contact your Novi Partnerships or Data Integration Manager.
